Web Phishing Detection Brainstroming:

Phishing attacks are becoming more and more sophisticated, and our algorithms are suffering to keep up with this level of sophistication. They have low detection rate and high false alarm especially when novel phishing approaches are use. The blacklist-based method is unable to keep up with the current phishing attacks as registering new domains has become easier. Moreover, comprehensive blacklist can ensure a perfect up-to-date database. Various other techniques such as page content inspection algorithms have been used to combat the false negatives but as each algorithm uses a different approach, their accuracy varies. Therefore, a combination of the two can increase the accuracy while implementing different error detection methods.

ACTIVITY

Unwanted request for permission to access camera,loacation and so on.

Stealing of user credentials

Your problem statement

GAJALAKSHMI.E

implement one time login system?

URL Redirection

accuracy scores displayed

integratable with popular web browsers

non technical users should be able to understand

should warn users before they complete the transaction

show stats to user maybe

should be able to identify urls without ssl certifcate

maybe show threat levels also
